

Hi Kids!! My name is Miss. Keeto
Have you seen me or any of my
friends before?!

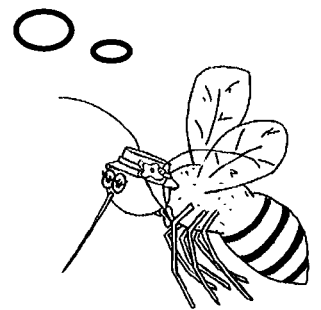

I might be small, but me and my friends can cause great big problems for people and animals.

Sometimes we spread disease to
dogs, horses and maybe even people!!!
How can you help to stop me??

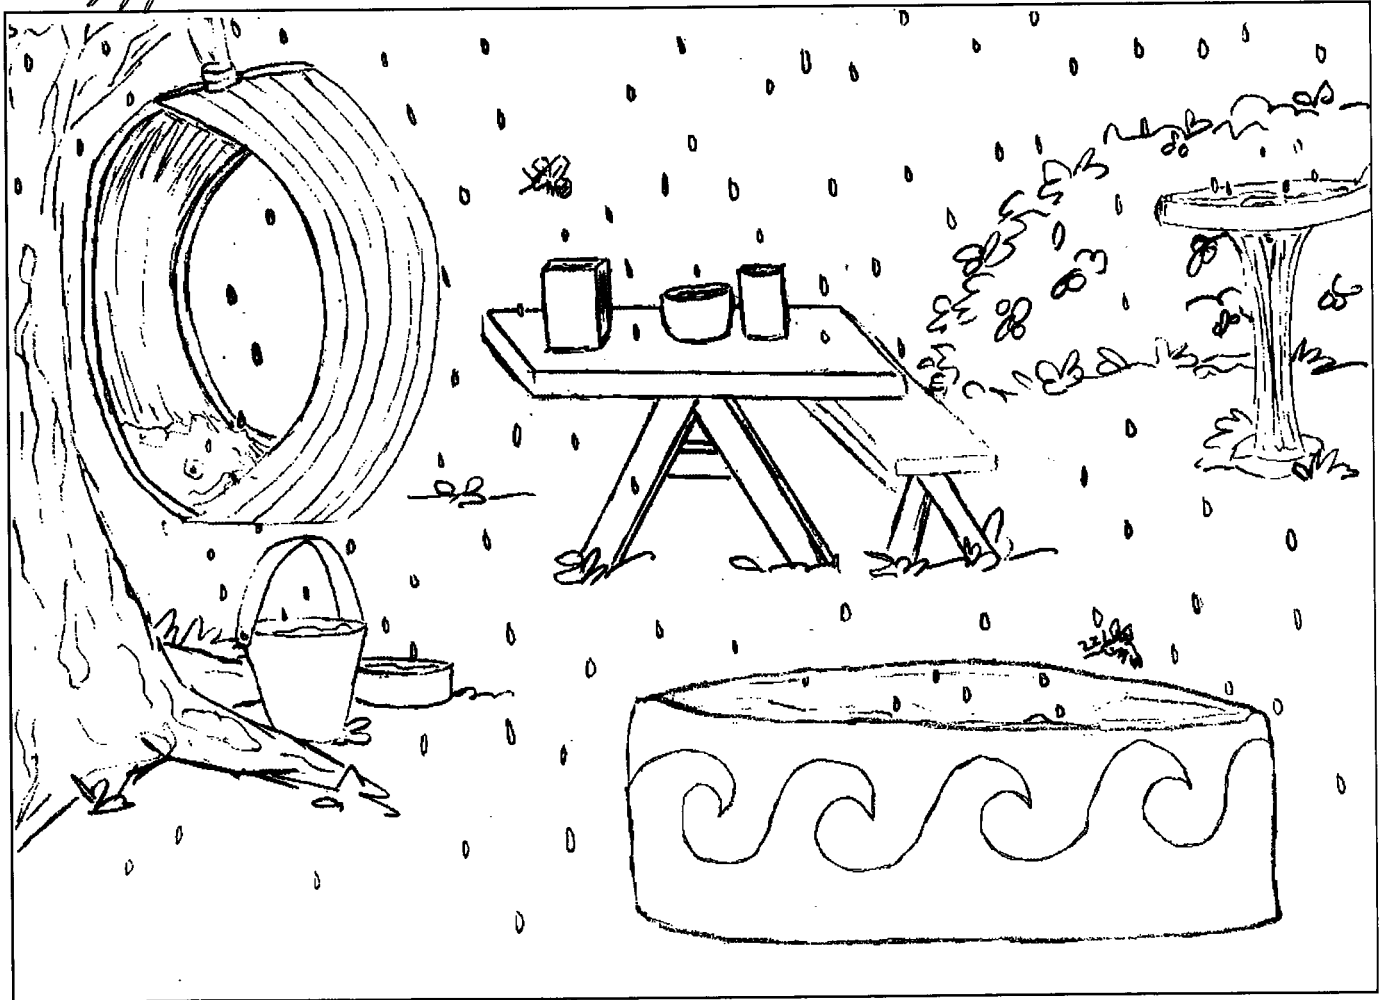

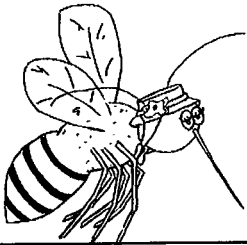

I grow up in places where water collects - kiddy pools, tire swings, any place water stays for too long.

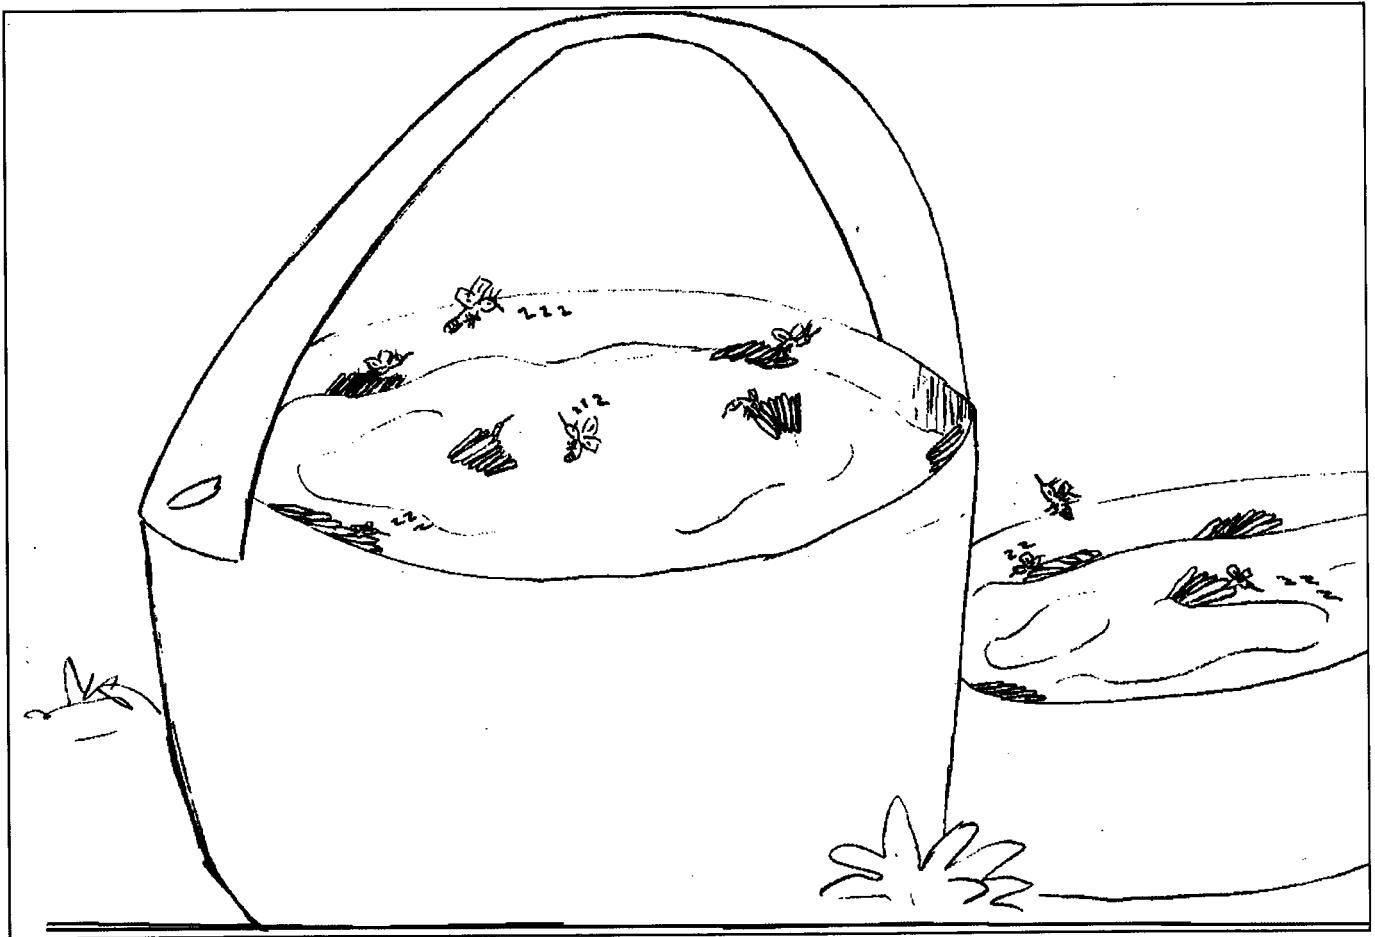

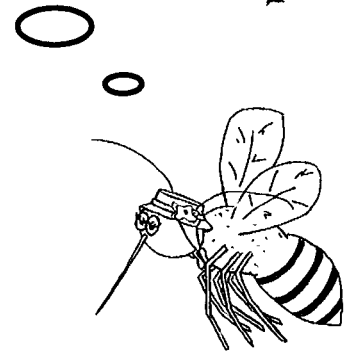

The rain fills these places with water - and if they don't get cleaned out, I can grow in there.

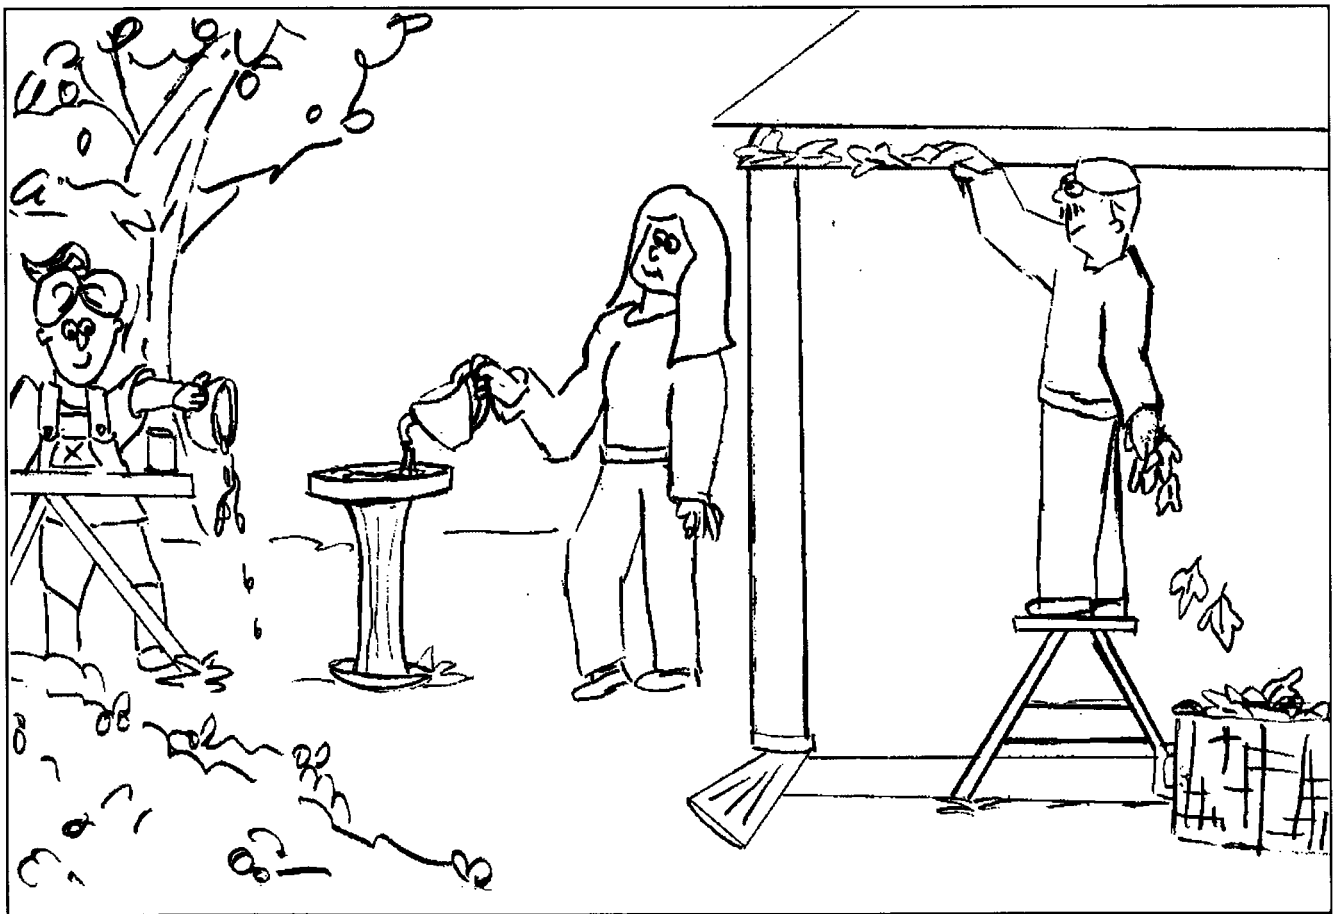

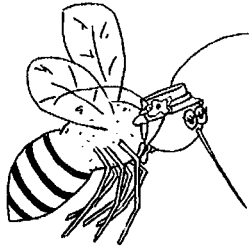

oo

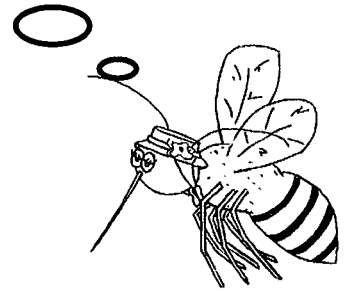

I lay eggs in the water, and soon
I will have many friends flying out to
bother you!!!

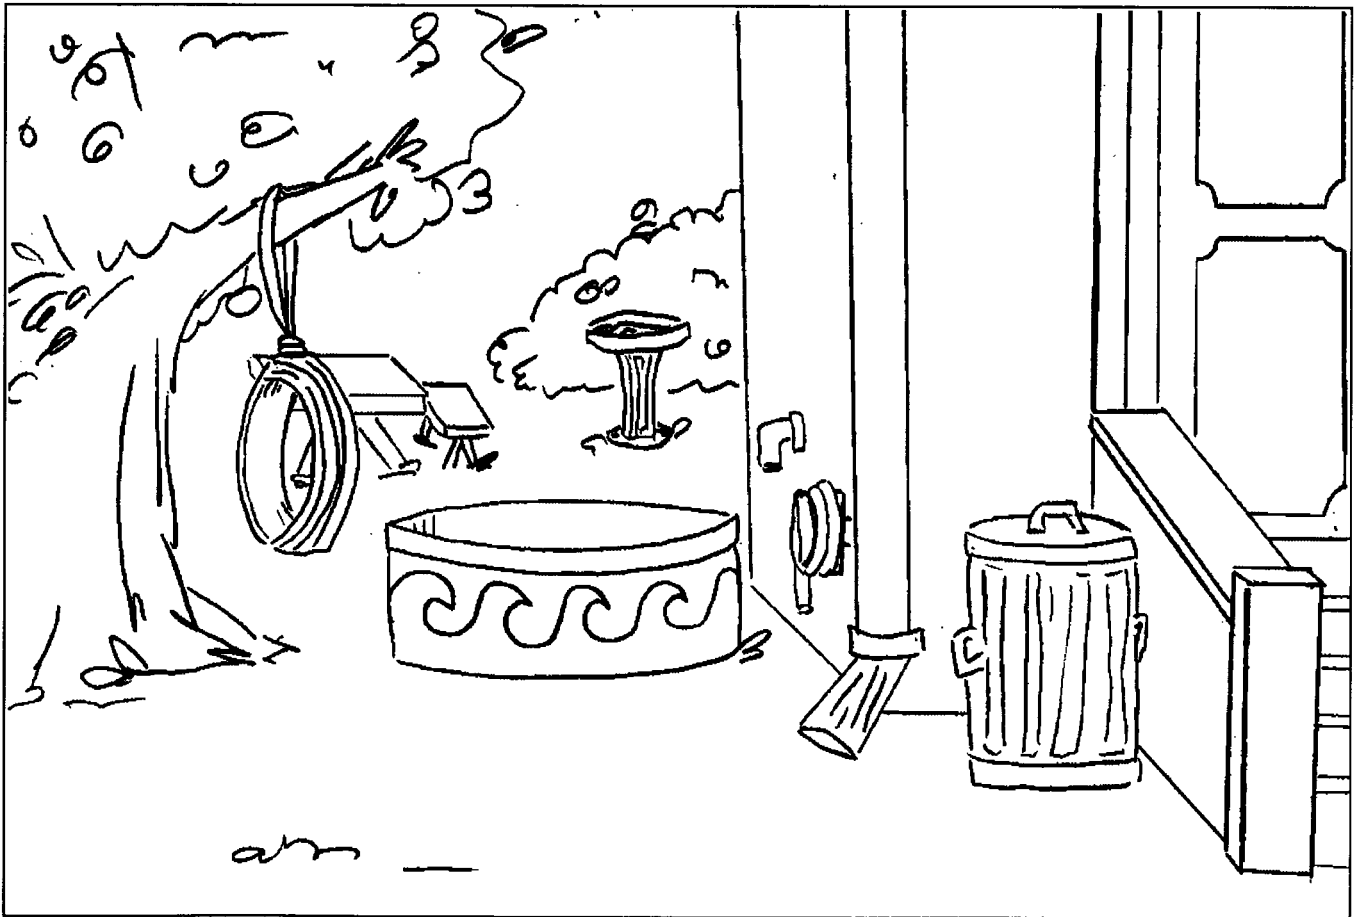

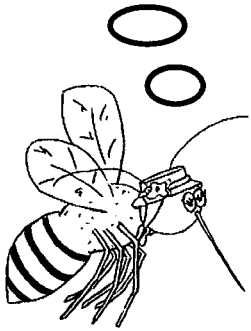

Find the areas I can grow up in,
and have Mom & Dad clean them
out each week!!

Put away outside toys, or empty them out each week or I may hatch out to bother you!!!

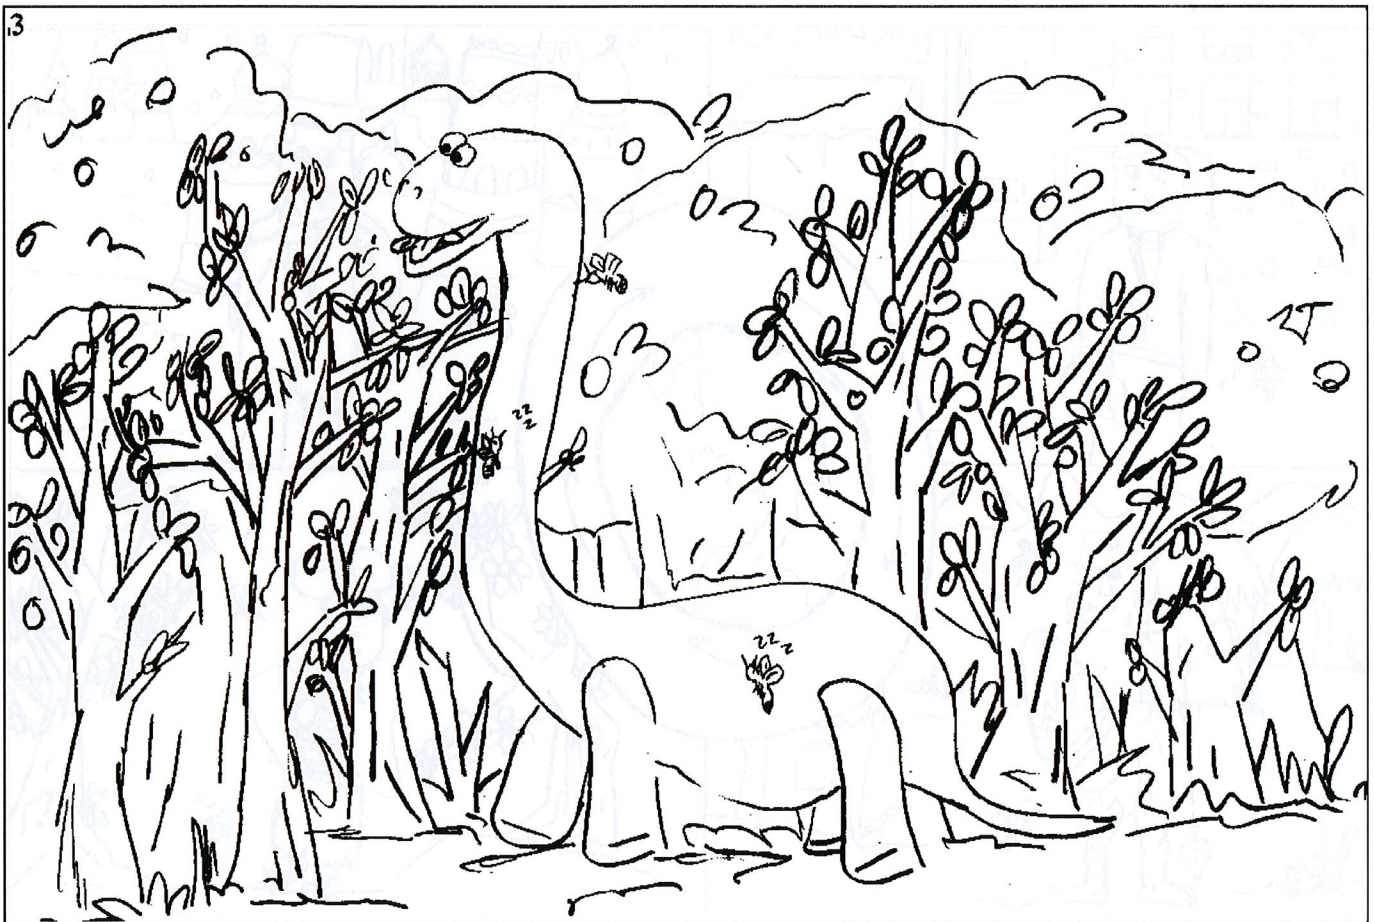

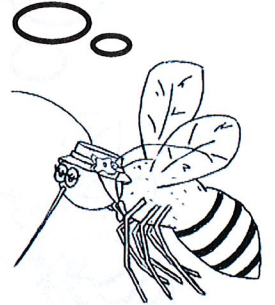

Look how clean this yard is.
Can you help to keep your yard
like this???

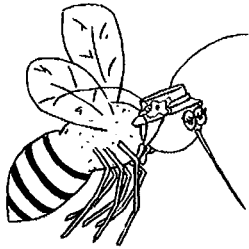

I bet you didn't know.....

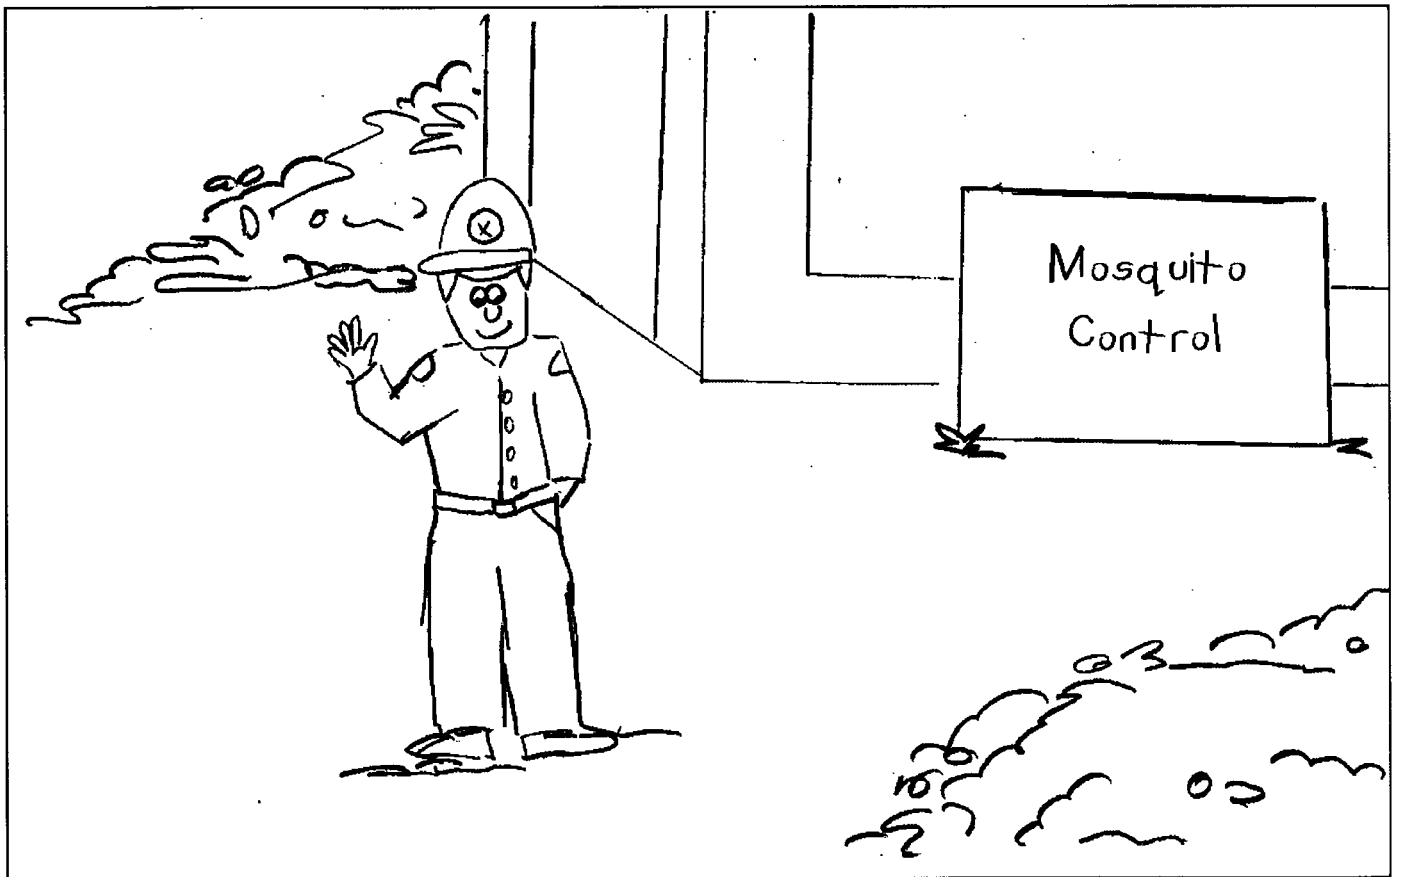

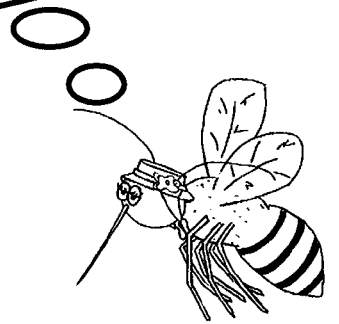

Mosquitoes have been around for millions of years - From when the dinosaurs were alive!!

Many people from around the world can get sick from my bite - You can help to keep me away!!

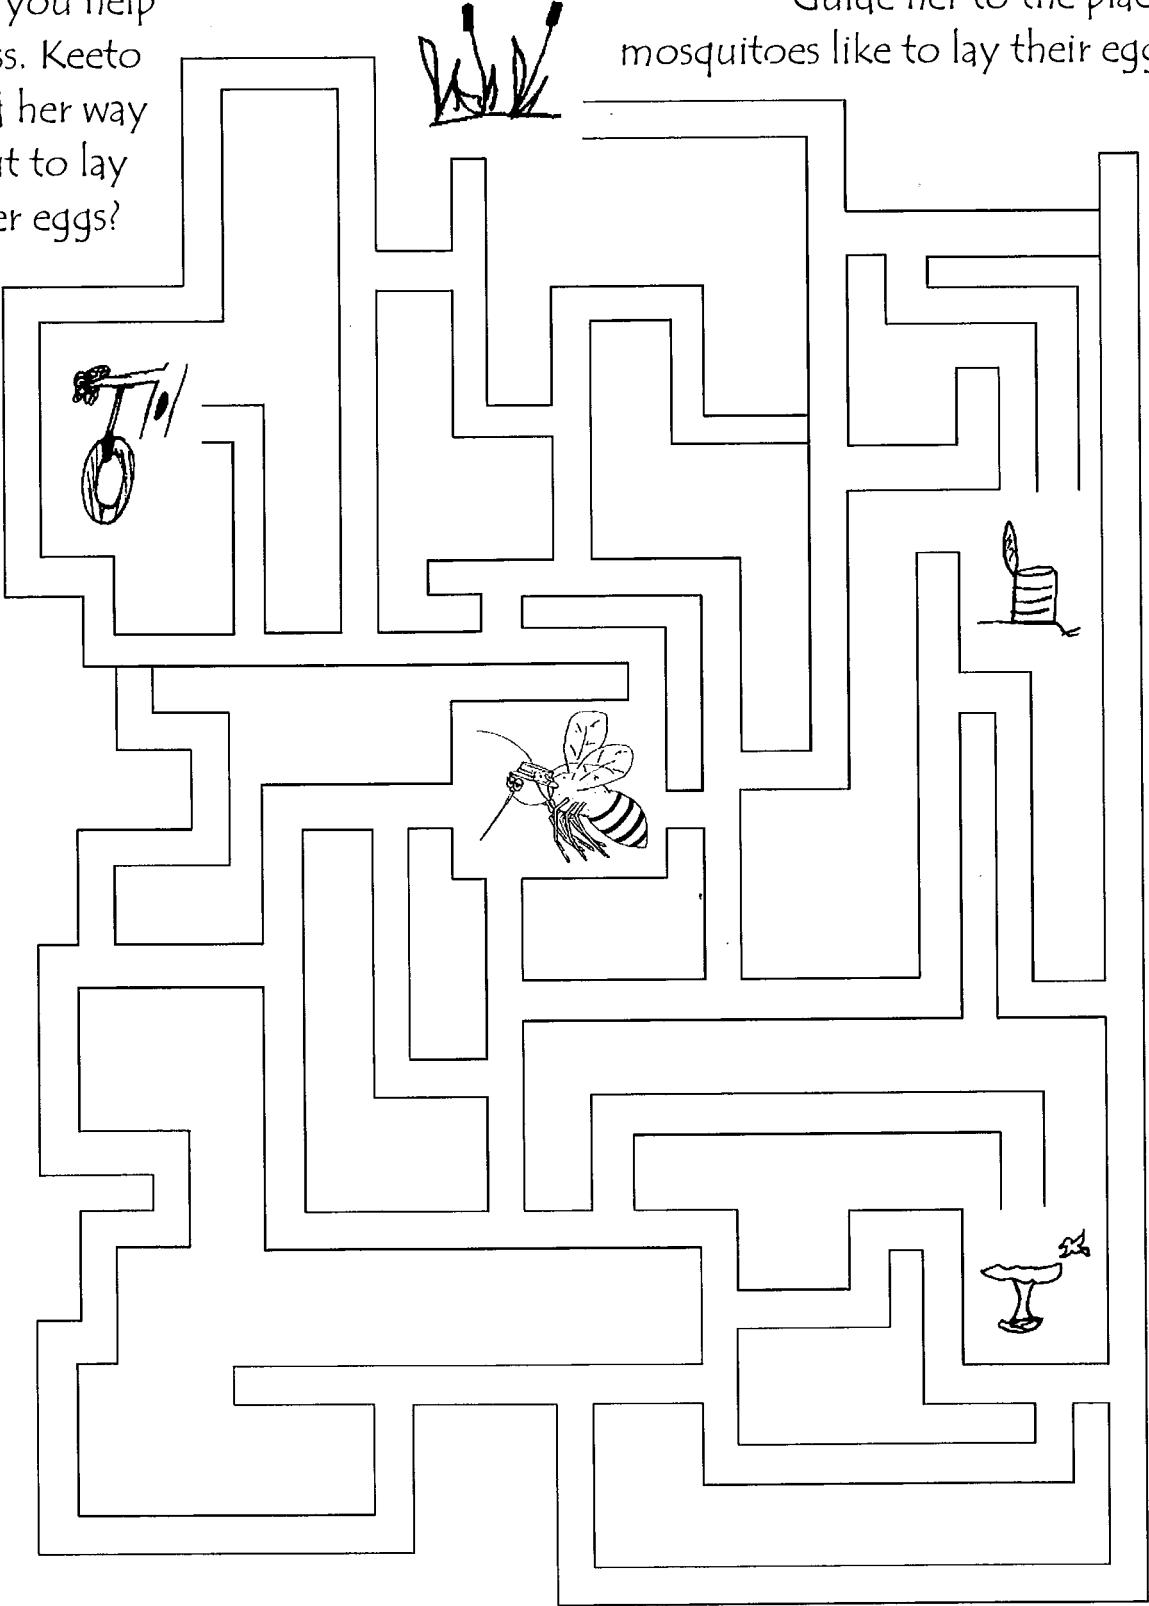

Your friends at Mosquito Control
have many ways to help you and
your family. Have Mom or Dad
give them a call!!

Can you help
Miss. Keeto
find her way
out to lay
her eggs?

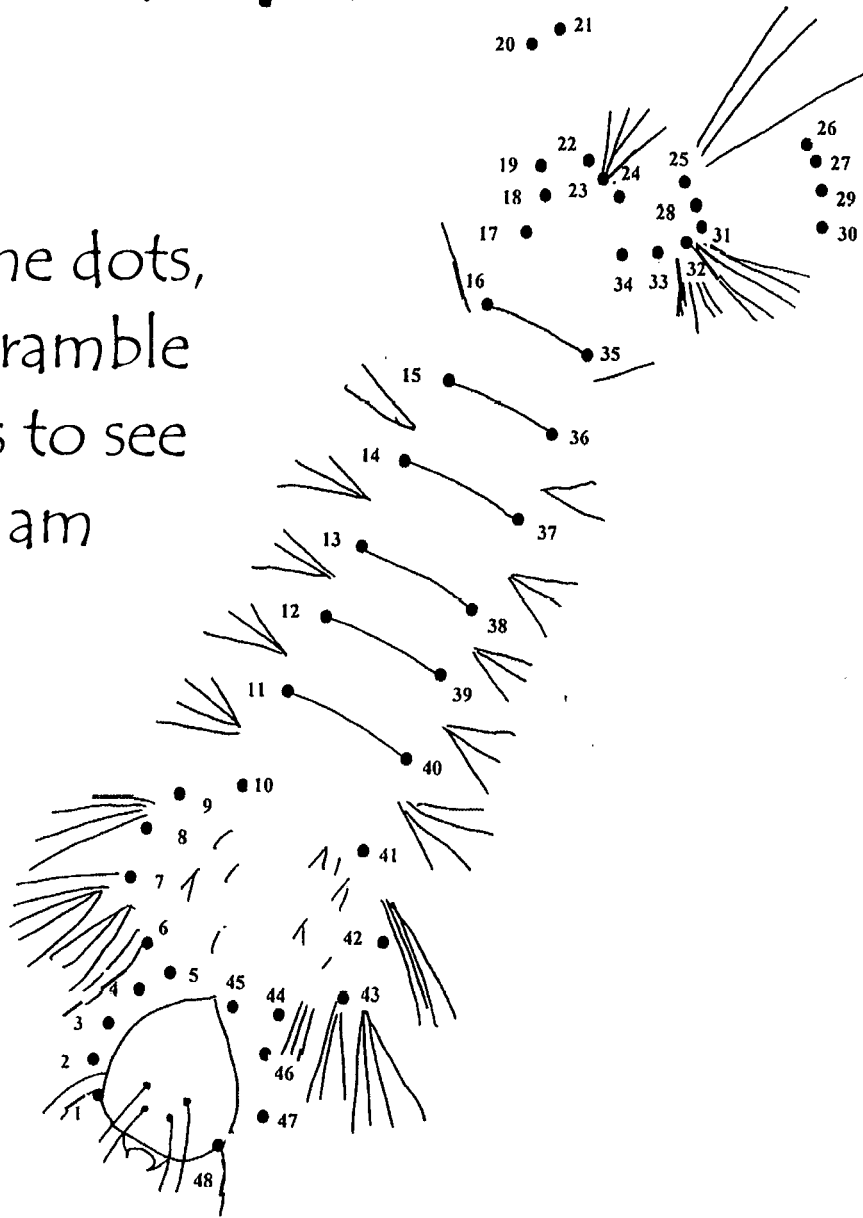

Guide her to the places
mosquitoes like to lay their eggs.

What am I??

Connect the dots,
then unscramble
the letters to see
what I am

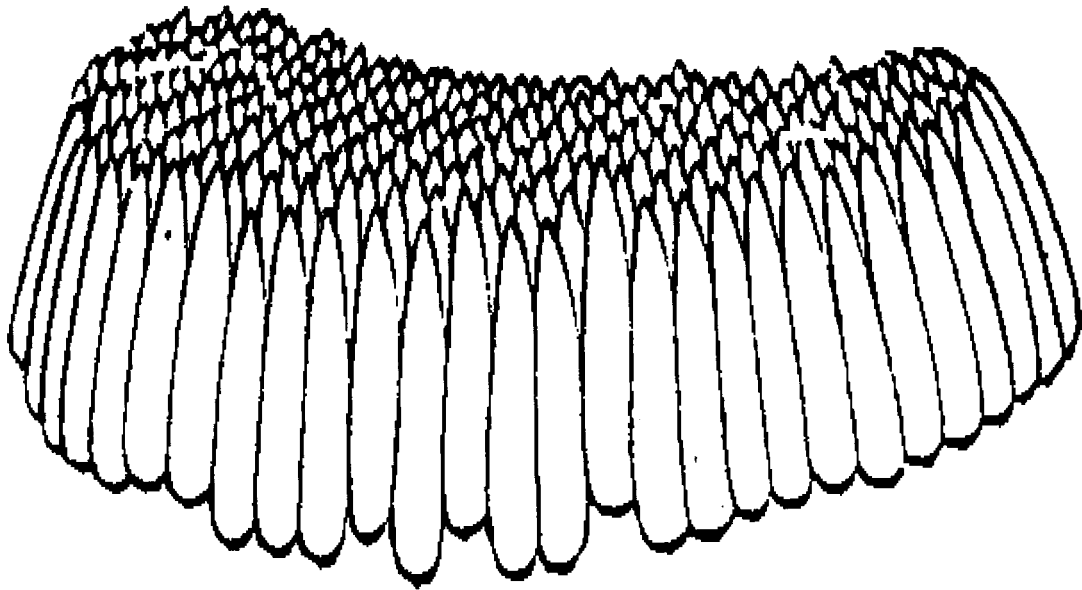

V E L A R A

Answer - LARVAE

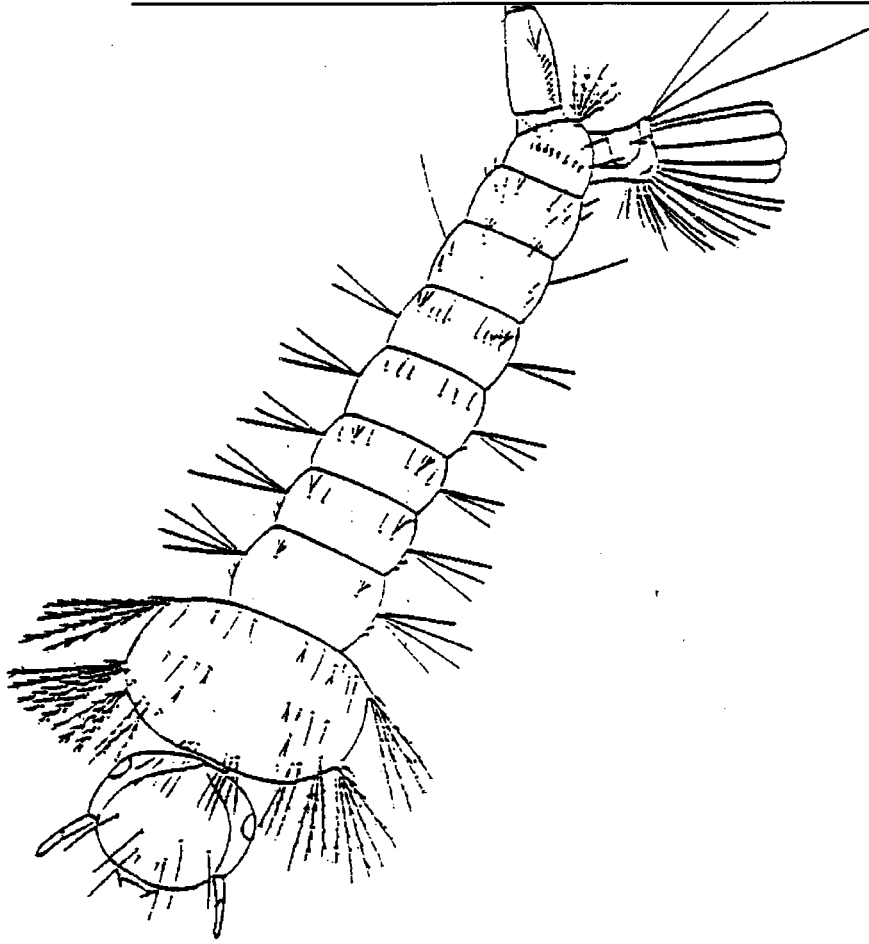

Mosquito Eggs...

These are laid in still water only. If you have any toys, sand buckets, or anything that can hold water outside, make sure your Mom or Dad empties it out after each time it rains.

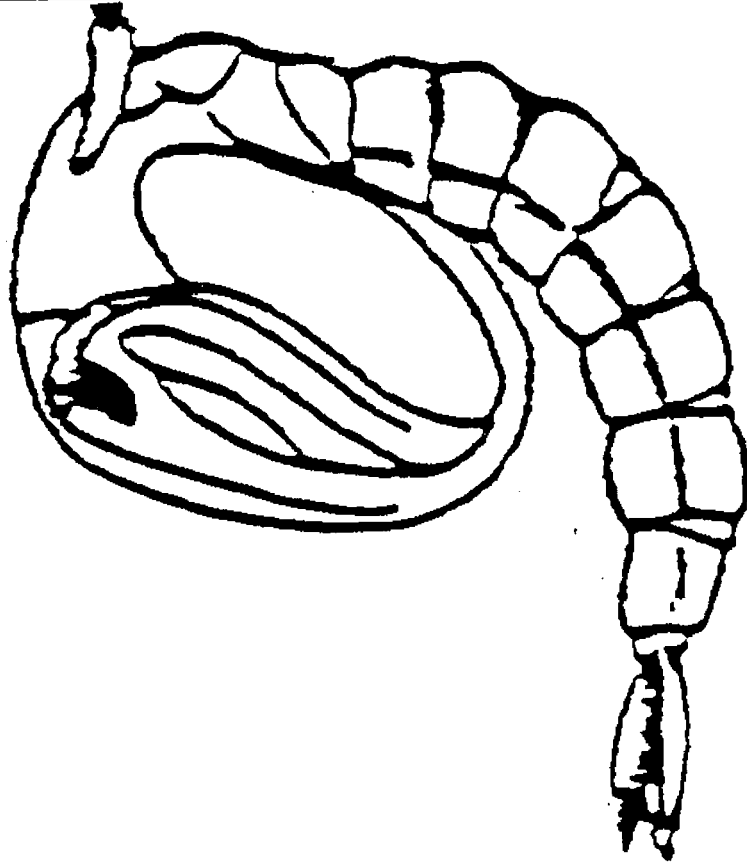

**DON'T GROW MOSQUITOES
IN YOUR OWN YARD!!!**

Mosquito Larvae...

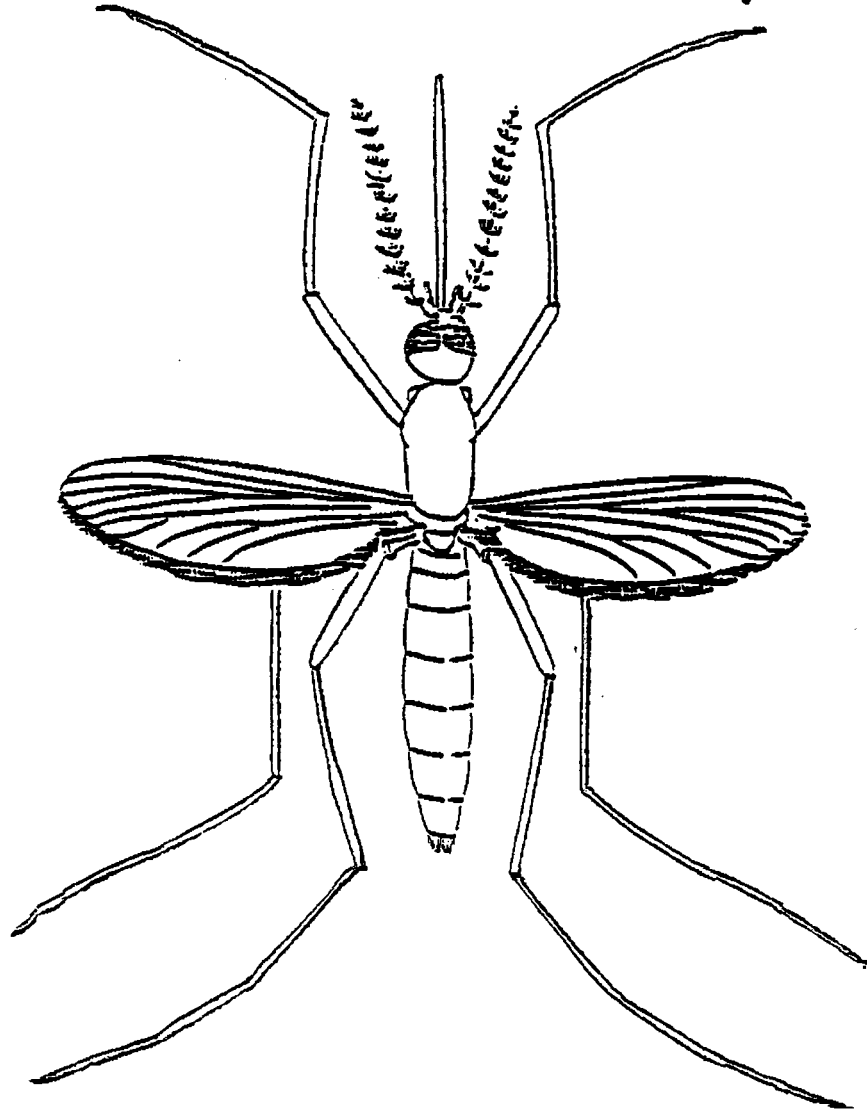

The larvae hatch out from the eggs, and live in the still water. If you see anything like me in still water, tell your Mom or Dad right away!! Don't let me hatch out and bite someone you know...even you!!

Mosquito Pupae...

This is what I look like just before I hatch out and fly away. If you see me, it's not too late to stop me before I hatch. Empty out the water I am in right away!!

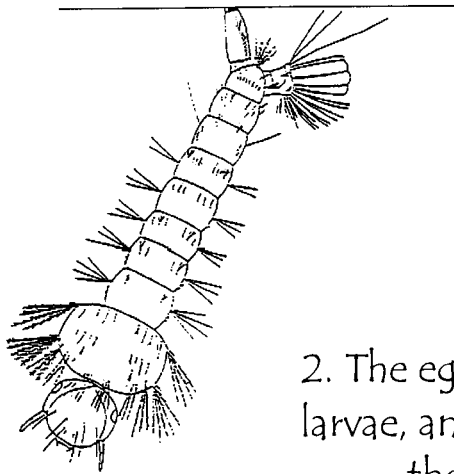

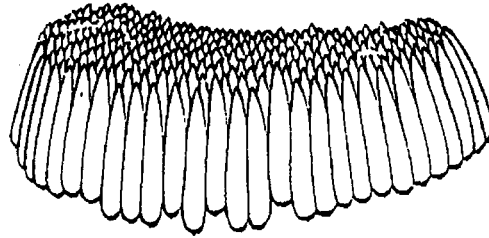

Mosquito Adult...

This is what most people think of when they hear the word mosquito. I can fly far looking for just the right animal to bite. If you see me, go someplace else where I can't find you!!

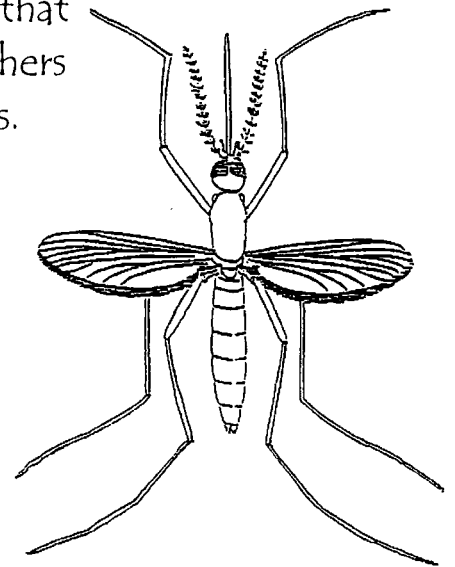

How a mosquito grows up

1. The eggs are laid in still water.

2. The eggs hatch into larvae, and they live in the water.

4. The pupae turns into the adult mosquito, that flies around and bothers you and your pets.

3. The larvae turn into a pupae. This is just before they hatch out from the water.
